

TESTING SERVICES UPDATE

VOLUME 3 ISSUE 2 May 2014

Keeping Up Credentials

Spring has sprung, after an unusually harsh winter for most of us. Spring brings warmer weather, blooming flowers and outside opportunities. It's a time of renewal. Here at NGC Testing Services, renewal means continuous improvement, ensuring quality, completing calibrations and other quality programs, as well as renewing and maintaining our important accreditations, such as IAS and NVLAP. Laboratory accreditations are more than just letters; they reflect upon our laboratories' practices and ensure that test results are accurate. In this issue, we explain what is

behind all those accreditation letters, and list worldwide accreditation organizations with mutual recognitions. There are a lot of letters overall, as you will see. Also in this edition, speaking of letters, we look at R-Value testing, one of the many tests we offer. We will focus on the very important flame-spread testing we conduct here, and explain why it is important for life safety. As always, let us know if we can help in your test projects or answer any questions.

Focus On: R-Value Test

Thermal conductance is the time rate of steady state heat flow through a unit area of a material induced by a unit temperature difference. Experimentally, to measure the thermal conductance of a material, place a test specimen between two parallel plates at constant but different temperatures and measure the steady state one-dimensional heat flux through the specimen.

Precisely Maintained Hot Plate

Heat Flux Transducer

Test Specimen

Heat Flux Transducer

Precisely Maintained Cold Plate

The inverse of thermal conductance is thermal resistance. Thermal resistance is the ability of a material to resist the flow of heat. In the building and construction industry, R-Value is a measure of thermal resistance. Under steady state conditions, it is the ratio of a temperature difference (ΔT) across a material and the heat flux (Q) flowing through it.

 $R = \Delta T / Q$

Here at NGC Testing Services, we test in accordance with ASTM C 518 to determine R-Value of materials utilizing the principles as illustrated.

What Do These Letters Mean?

ACCREDITATIONS/LISTINGS

Any laboratory you utilize should be accredited. Be sure to check a lab's scope of accreditation (list of tests it is accredited for) by looking under its lab code for that accreditation or listing. At NGC Testing Services, we are proud of our accreditations, which we believe are most preferred in the industry for the testing services we provide.

Gaining and maintaining accreditations requires a significant amount of effort, which includes establishing a comprehensive quality system, collection of data and periodic in-depth, on-site assessments.

NGC Testing Services Laboratories' Accreditations include:

NVLAP Accredited

Lab Code: 200291-0

NVLAP or the National Voluntary Laboratory Accreditation Program is administered by the National Institute of Standards and Technology (NIST), part of the U.S. Department of Commerce. read more >>

ACCREDITATIONS/LISTINGS CONTINUED

IAS Accredited

Testing Laboratory 216
IAS or International Accreditation Service (IAS) is a subsidiary of the International Code Council (ICC)

City of New York, MEA

Acceptance Laboratory No. 102-01-L

California State Fire Marshal (OSFM)

Approved Testing Laboratory

Florida Building Commission

Approved Product Testing Laboratory

UL's Third Party Test Data Program (TPTDP)

Acoustical Testing File DA1294

ISO/IEC 17025 Compliant

This is the basic requirement utilized by most laboratory accreditation organizations. Issued by the International Organization for Standardization (ISO) and the International Electrotechnical Commission (IEC), it is the single most important standard for calibration and testing laboratories around the world. Laboratories that are accredited to this international standard have demonstrated that they are technically competent and able to produce precise and accurate test and/or calibration data.

Mutual Recognition Arrangements

In addition, there are Mutual Recognition Arrangements (MRA) among accreditation bodies around the world that include NVLAP and IAS, our primary accreditations. Two MRAs are APLAC (Asia Pacific Laboratory Accreditation Cooperation) organization and ILAC (International Laboratory Accreditation Cooperation). The following are lists by country and corresponding accreditation bodies that have signed a Mutual Recognition Arrangement through APLAC and/or ILAC:

APLAC MRA

Australia: NATA Canada: SCC, CALA, QMP-LS People's Republic of China: CNAS Hong Kong China: HKAS India: NABL. NABCB Indonesia: KAN Japan: JAB, IAJapan, VLAC Republic of Korea: KOLAS Malaysia: Standards Malaysia Mexico: ema Mongolia: MNAS New Zealand: IANZ Pakistan: PNAC Papua New Guinea: PNGLAS Philippines: PAO Russian Federation: AAC Analitica Singapore: SAC Sri Lanka: SLAB Chinese Tainei: TAF Thailand: DMSc, DSS, NSC-ONAC USA: A2LA, ACLASS, IAS, A-S-B, NVLAP, PJLA, AIHA-LAP Vietnam: BoA Australasia: JAS-ANZ **Brunei Darussalam Gulf Region:** GAC

DIDYOUKNOW?

ASTM E 84 is one of the most widely accepted fire-testing methods. Commonly known as the

"tunnel test," it checks the "Surface Burning Characteristics of Building Materials." It was introduced in the early 1920s to evaluate "white wash" coatings. Currently, virtually all materials in buildings and other structures that require acceptance from national code bodies undergo the tunnel test. Typically, results are designated by code bodies as class A, B and C.

In November 1942, the Boston Cocoanut Grove nightclub went up in flames when synthetic palm tree decorations caught fire, killing 492. In February 2003, the pyrotechnics of headlining band Great White ignited the Station nightclub in West Warwick, R.I., killing 100 and injuring 230. In both cases, the same type of flame spread escalation that is attempted to be recreated in the tunnel test was noted. With this in mind, ASTM E 84 is an extremely important safety test.

The tunnel itself has been designated the "Steiner Tunnel," named after Albert J. Steiner, an engineer who developed this and other fire-test methods. The 2 ft. x 24 ft. long horizontal tunnel is a closely controlled environment to ensure repeatable test results. Red oak flooring and cement board are utilized as reference standards in its calibration. In addition to ASTM E 84, this test method is also known as NFPA 255, UL 723 and UBC 8 1.

At NGC Testing Services, we conduct this and other important fire-testing procedures. Please call 716.873.9750 for details.
